

CARE AND USE OF MAGNETIC SIGNS

Never apply signs on uneven or heavily contoured surfaces. The entire surface of the sign must be in contact with the underlying surface.

If signs are left in place for prolonged periods the paint surface underneath the sign will be protected from UV degradation and may vary in colour to the surrounding area when the sign is removed and other surface degradation may occur over time from slight abrasion. To help avoid these issues please follow the guidelines below.

1. Ensure the sign and vehicle surfaces are clean & free from grit, dirt and water before attaching the sign and make sure that there is no metal contamination magnetically attached to the sign before application.
2. Do not apply to newly painted surfaces - paint must be fully cured prior to use.
3. Remove the sign periodically (especially when vehicle is washed) clean the sign and vehicle with warm soapy water and then dry thoroughly before re-applying.
4. To help prevent abrasion damage use a high quality wax polish prior to application.
5. Remove the signs from the vehicle when they are not needed.
6. Always clean & dry signs before storage & store signs flat, not rolled.
7. Never allow signs to be contaminated with any small metallic objects e.g. iron fillings, pins etc.
8. Signs are suitable for application to vehicles with speeds up to 70mph provided all of the above points are adhered to.
